MORE ABOUT FREMEDICA

FREmedica CEO Stephen Davis' daughter (who was sick for 12 years) and two grandsons were diagnosed with Lyme disease a number of years ago. Stephen researched various treatment options to help his family with very little success. During his search for a solution, he began working with Stuart Gross, who was working on a technology using light to deliver a variety of frequencies at the time. Waveforce had already developed three prototype devices that used frequencies delivered via light emitting technology with good results. Stephen's daughter and two grandsons participated in a small trial using this unique package of frequencies, delivered by light and they have been symptom free for over 5 years after using the 2nd and 3rd generation devices.

In 2016, Waveforce's technological advances won the Thomas Edison 'Tommy Award' for Innovation. In 2016 Waveforce incorporated FREmedica Technologies to deal with all frequency emitters and frequency packages that were related to chronic Lyme disease. After this, a fourth device was designed, which was named 'waveforce ONE'. This version was the first wearable product of its kind and debuted in July 2017. In 2018 we launched a programmable version called the Wave 1 which is still the same product today producing the same positive results for clients with chronic Lyme disease.

Our purpose is to enable people living with the debilitating symptoms of chronic Lyme disease to live a full, healthy, symptom-free life. We do this by providing The Lyme Frequency Support Program via the Wave 1, an innovative wearable delivery system.
